all chart types are available in a pivot version. This versatility enables you to utilize various chart types, including column charts, bar charts, pie charts, scatter charts, and more, providing flexibility in visualizing your data.

Below is an example of a PivotChart:

DIFFERENCES BETWEEN PIVOTCHARTS AND STANDARD CHARTS

To clarify the advantages and distinctions between traditional and PivotCharts, here's a compiled list of the main differences:

1. **Data source**
   PivotCharts are based on PivotTables, which offer dynamic updates and exceptional flexibility in response to changes in the underlying data. In contrast, standard charts are constructed based on a fixed range of data.

2. **Flexibility**
   PivotTables offer greater flexibility compared to standard charts. This is because you can effortlessly alter layout, formatting, and filtering options. Consequently, analysing data from various perspectives becomes significantly more effective with PivotTables. In contrast, standard charts are relatively more limited in this regard.

3. **Interactivity**
   PivotCharts offer high interactivity, enabling users to filter and delve into data depth with minimal effort. Users can easily select specific data points and filter the chart to display only relevant information. Conversely, standard charts lack this level of interactivity, remaining
