static and unable to offer such dynamic exploration capabilities.

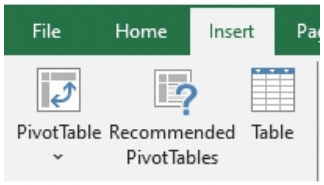

4. **Merging**
   PivotCharts automatically merge and summarize the data from PivotTable, making it easy to create charts that display summary statistics such as totals, averages, and percentages seamlessly.
   In contrast, standard charts require manual merging of data before chart creation, adding an extra step to the process.

PivotTables are more dynamic, flexible, and interactive than standard charts. They provide access to better analysis and more immediate visualization of large data sets, as well as automatic aggregation and summarization of data for the user. Standard charts, while useful for small data sets, do not have the same level of functionality and interactivity.

CREATE A PIVOTTABLE OR PIVOTCHART

To create a PivotTable or PivotChart from the data in an Excel worksheet, follow these steps:

1. Select data range you want to use to make *PivotTable* or *PivotChart*.
2. Click on the Insert tab on the ribbon bar and select the *PivotTable* or *PivotChart* item. Or you can right-click on the selected data range and select PivotTable or PivotChart from the context menu.

3. The Create *PivotTable* or Create *PivotChart* dialog box will appear. Now ensure that the selected data range is correct and click *OK*. A new worksheet with an empty PivotTable or PivotChart will be created.
4. Drag into the *PivotTable Fields* or *PivotChart Fields* panel the fields you want to analyse and move them to the appropriate areas of the PivotTable or PivotChart. For instance, to group data by rows, drag them to the *Rows* area.
