BASICS OF MACROS RECORDING

To start recording a macro, you first need to find the macro recording function located on the *Developer* tab. Usually standard versions of Excel are released with the *Developer* tab hidden, this means that the function may not be visible at first glance.

If you plan to work with macros and VBA programming it is advisable to make the Developer tab visible. To do so, follow these steps:

1. Select the File item located on the ribbon bar and then choose the Excel *Options* item.
2. In the Excel Options dialog box, select the *Customize Ribbon* item.
3. A list box will appear on the right, click and place a check mark next to the *Developer* item.
4. Click *OK* to return to the Excel interface.

Now the *Developer* tab will be visible in the ribbon bar, and you can start the macro recording function.

RECORDING A MACRO

To start a recording process, select the Record Macro item found on the Developer tab. The recording macro will be displayed in the dialog box and will be divided into four parts:

- **Macro name:** Excel will assign a default name to the macro, like Macro1. However, you may want to give your macro a more descriptive name, highlighting its function. For instance, you can name a macro that formats a generic table with the name “TableFormatter”.
- **Hotkey**: Every macro requires a trigger to activate it. This could be a button to press, the opening of a workbook, or a key combination.
  When you assign a hotkey to the macro, the chosen gesture will cause the macro to start. This is an optional setting, so it is not mandatory to choose a hotkey if not needed.
- **Store macro:** usually the default option is given by This workbook. Storing the macro in the current workbook simply means that the macro will be stored along with the currently
