active Excel file.

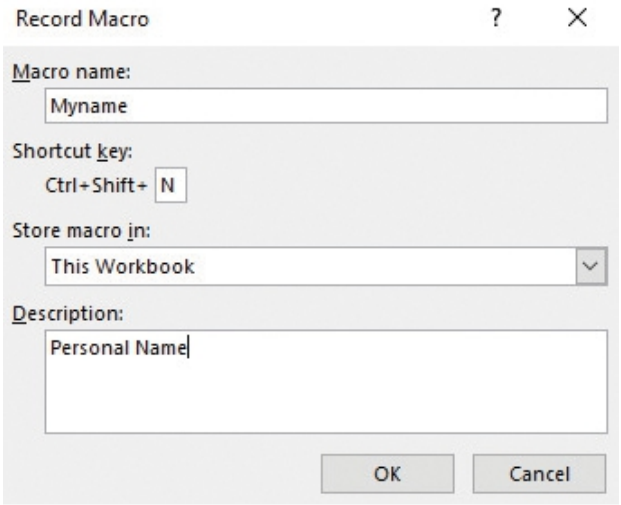

In this case, the next time that workbook is opened, the macro will be available for execution. Likewise, if the file is shared with another user, that user will also have access to the macro.

- **Description:** this field is optional but can be useful when you have multiple macros within the same worksheet or need to provide additional information to another user working on the same file.

Suppose we want to create a macro that inserts our name into a cell in the current workbook.

In this scenario, while keeping the Record Macro dialog box open, we will need to follow these steps:

1. In the *Macro Name* field, enter a new name for the macro consisting of one word, replacing the standard *Macro1* name. For example, you can choose "*MyName*".
2. In the *Shortcut Key* field, enter capital N. This will make the shortcut key the keyboard combination *Ctrl+Shift+N*.

3. Click *OK* to close the *Record Macro* dialog box and begin the recording process.
4. Select a cell in the worksheet and type your name in the chosen cell, then press *Enter*.
