5. Go to the *Developer* menu, choose the *Code* option, and finally *Stop Recording*. Alternatively, you can click the *Stop Recording* button located in the status bar.

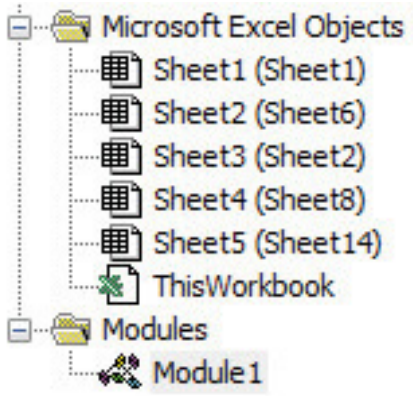

REVIEW A MACRO

Once the macro has been registered in a new form, the Visual Basic (VB) editor must be activated to view the code. This can be done in two ways:

- Clicking *Alt+F11*,
- By going to the *Developer* menu item and selecting *Code* and then *Visual Basic*.

Within the editor, the project window enables you to view a list of all open workbooks and add-ons. This list is presented in the form of a tree diagram, allowing you to expand or collapse it as needed.

By following this path, you can access the code that was previously recorded and stored in the current workbook file. Double-clicking on Module1 will display the code in the window.

The macro should look like this:

```
Sub Myname()
'
' Myname Macro
' Personal Name
'
' Keyboard Shortcut: Ctrl+Shift+N
'
ActiveCell.FormulaR1C1 = "Luca Rossi"
Range("H9").Select
End Sub
```

In this example, the recorded macro is a Sub procedure named *MyName*
