in which Excel s instructed on what to do when the macro is selected.

At the beginning of the procedure, Excel includes some comments containing the information from the Record *Macro* dialog box. These comments are recognizable as they begin with an apostrophe and are not essential for the macro to function correctly. Therefore, deleting them does not affect the execution of the macro.

You can see that this procedure has only one VBA instruction:

ActiveCell.FormulaR1C1 = "Luca Rossi"

This instruction reports the fact that the name entered during recording must be inserted into the active cell.

In general, prefixing any text with a single apostrophe creates a comment. Commented lines are displayed in green, and Excel will bypass these lines when running the macro.

Comments serve a useful purpose in code by allowing users to add personal notes, document the code's functionality, describe the business rule applied, or provide any other relevant information that aids in code comprehension.

TESTING MACRO

Before recording a macro and after you configure a hotkey combination option (in this case *Ctrl+Shift+N*), it is important to test the macro. Two ways can be used to do this:

- Click *Alt+F11*,
- Select the *View* item located on the toolbar of the *VB Editor*.

Select a cell and press *Ctrl+Shift+N*: the macro will immediately insert the name into the cell.

In the example, we chose the cell to format before initiating the macro recording. This step is crucial because selecting a cell while the macro recorder is active results in that cell being recorded in the macro. Consequently, the macro would consistently format that particular cell.

MODIFY A MACRO

After you recorded a macro, you can update it. Continuing with the previous example, let's say we wish to update our name and have it written in bold font. In this scenario, instead of re-recording the macro, it's more
