efficient to edit the existing code since it's a straightforward modification.

To edit a macro, follow these steps:

1. Click *Alt+F11* to activate the appropriate editor window.
2. Double-click the Module1 entry and insert the following instruction before the *End Sub* instruction: *ActiveCell.Font.Bold = True*.

The modified macro will appear as follows:

```
Sub Myname()
'
' Myname Macro
' Personal Name
'
' Keyboard Shortcut: Ctrl+Shift+N
'
ActiveCell.Font.Bold = True
    ActiveCell.FormulaR1C1 = "Luca Rossi"
    Range("E7").Select
End Sub
```

Testing the macro again, the name will appear in bold as insert.

## ABSOLUTE AND RELATIVE RECORDING

After exploring the fundamentals of the macro recording interface, it's advantageous to delve deeper and begin recording macros.

The key concept to grasp is that Excel offers two recording modes: absolute reference and relative reference.

#### *RECORDING MACROS WITH ABSOLUTE REFERENCES*

The default recording mode in Excel is based on absolute reference. This term denotes a condition where a cell reference in a formula remains fixed and does not adjust automatically when the formula is copied to a new location.

For instance, if we aim to create a macro to count the number of rows in a worksheet containing bank branch data, the recording process proceeds as follows:

1. Make sure that cell A1 or the cell of your interest is selected.
2. On the *Developer* tab, select the Record Macros item.
3. Name the macro *BranchesTotals*.
4. Choose *This Workbook* for the saving location.
5. Click *OK* to start recording. At this point, Excel will begin recording
