written while recording the macro:

```
Sub BranchesTotal()
'
' SubsidiariesTotal Macro
'

'
    Range("B11").Select
    ActiveCell.FormulaR1C1 = "TOTALE"
    Range("A11").Select
    ActiveCell.FormulaR1C1 = "=COUNTA(R[-9]C:R[-1]C)"
    Range("A12").Select
End Sub
```

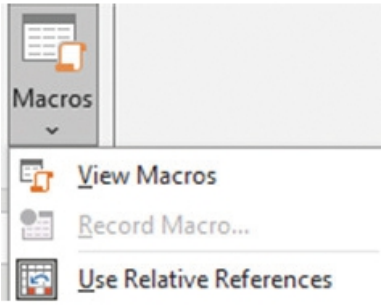

If you pay attention to the two lines of code that select the range B11 and A12, it is easy to see that the macro was recorded in absolute reference mode. In this case, Excel interprets the range with absolute cell references. This implies that regardless of the cursor's position in the workbook, when the recorded macro is executed, the program will select cell B11 and cell A12.

MACRO RECORDING WITH RELATIVE REFERENCES

The term "relative" means that the program will interact with the active cell at the time of recording. Consequently, it's crucial to pay attention to the active cells both during the recording of a macro with relative references and when executing it.

To record macro with relative reference, follow these steps:

1. On the *Developer* tab, select the Use *Relative References* option.
2. Make sure that the cell of interest is selected.

3. On the *Developer* tab, select the *Record Macros* option.
4. Name the macro *BranchesTotalsRelative*.
