workbooks deemed trustworthy can reside.
By establishing a trusted location, users can execute and manipulate workbooks, including activating macros, without encountering security barriers, as long as the workbook remains within that specific directory. To configure a trusted location, proceed as follows:

1. On the *Developer* tab, select the *Macro Security* button. This activates the *Trust Center* dialog box.
2. On the left, click on *Trusted* Locations. The *Trusted Locations* menu will open, showing all file directories that are considered trustworthy.
3. Click on *Add New Location*.
4. Click *Browse*, identify and select the location that you want to designate as a trusted location. Once you've specified the trusted location, any Excel document opened from there will be considered trusted, and your macros will be automatically enabled.

- **Assign a macro to a button**
  Creating macros often involves ensuring they can be executed in a clear and straightforward manner. For instance, a basic button can offer a simple yet effective interface for all users. Excel provides a variety of helpful form controls for building user interfaces directly within worksheets. These controls include buttons (the most used), as well as checkboxes and scrollbars. To utilize them, you simply need to insert the desired module control into the worksheet and then assign a pre-existing macro to it. When users click the control button, the assigned macro will be executed smoothly. For example, to add a button to the *BranchesTotalRelative* macro, you can follow these steps:

  1. On the *Developer* tab, click the *Insert* command.
  2. In the drop-down list that will appear, select the control button you want to insert
