VALIDATION AND DATA PROTECTION

Data validation and protection are important aspects of working with Excel worksheets, especially when dealing with sensitive or important data. In the following sections we will explore some useful techniques for validating and protecting data when working with Excel.

These techniques and tools are instrumental in guaranteeing the accuracy, security, and safeguarding of data from unauthorized access or alterations.

DATA PROTECTION

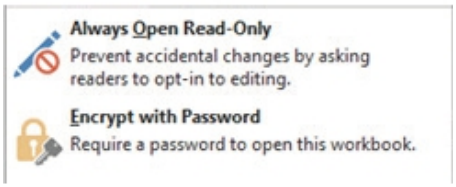

Data protection involves safeguarding the worksheet and its contents against unauthorized access, alterations, or deletion. This encompasses measures such as password protection for the entire workbook or specific cells, encryption of data within the worksheet, and shielding formulas and other sensitive information from unauthorized viewing or modification.

Implementing data protection measures is crucial for upholding the confidentiality and integrity of data within the worksheet, particularly when handling sensitive or confidential information.

PASSWORD PROTECTION

You can protect the Excel document with a personal password. Follow these steps:

1. Select the *File* tab of the ribbon and choose Info option. Then *Protect Workbook* > *Encrypt with Password*.
2. From here you will be able to enter a password that will be used to open the file. Alternatively, you can choose the options *Always Open Read-Only* or *Restrict Access* to limit editing and formatting options.

3. If there are specific cells or ranges that contain sensitive data, you can protect these areas with passwords as well. Simply select the cells you want to encrypt, right-click, and choose *Format Cells.*
4. On the *Security* tab, check the box *Locked*.
