check the box next to *Show error alert after invalid data* inside the error alert menu.

7. You can customize the style of the warning box (*Stop*, *Warning or Information*). Finally, click *OK* to save the data validation settings.

At this point, when a user inserts data into a cell or range of cells, Excel will validate them according to the set rules and show an error message if the entered data is not valid.

DATA VALIDATION RULES

There are different types of data validation rules that can be applied to cells in Excel:

- **Validation rule for Date and time**
  Using this rule, for example, a user can only schedule an appointment for a future date. Specifically, follow these steps:

  1. Choose the *Data* item in the *Settings* tab box.
  2. The selection of *Data* limits the validation cell input to dates only.
  3. In the data box, enter the data validation criteria after choosing a condition from the data drop-down list.
