

NOTE: You can efficiently adjust settings for data validation across multiple cells. By selecting the *Apply these changes to all other cells with the same settings option*, the new data validation settings will be applied to all cells that share the same criteria.

- **Validation rules for whole numbers**
  Keeping the appointment example, a limitation could be set to allow a maximum of 3 clients per appointment. This ensures that when a user attempts to input a number exceeding 3 or a non-integer value, an error message will prompt, indicating invalid data. Follow these steps:

  1. On the *Settings* tab, choose the *Whole Number* option as the data validation criterion.
  2. In the *Data Validation* dialog box, choose a condition on the data entry. To specify the range, you can choose between and type the numbers 1 and 3. This will allow users to enter only 1, 2 or 3.
