- **Validation rule for text length**
  The data validation function in Excel enables you to establish specific criteria for the data allowed in a cell. For instance, you can stipulate a maximum text length, ensuring that any input exceeding this limit is flagged as invalid.

  To enter this validation type, follow the steps:

  1. Choose the *Text length* option as the data validation criterion from the *Settings* tab.
  2. Choose a condition for data validation from the appropriate box. For instance, *Minimum* and *Maximum* usable characters.

- **Validation rule for list**
  You can insert drop down lists prompting users to select from predefined options. Once a user chooses an item from the dropdown list, it automatically populates the respective cell with their selection.

  To implement this type of list, follow these steps:

  1. Choose the *List* option as the data validation criterion.
  2. The drop-down menu items can now be inserted into the source box, alternatively you can specify a range of cells.
