In this case, simply create separate sections within the same worksheet, adding the different expense categories and using more suitable formulas to calculate the totals for each category and compare them with the budget. In addition, it may be useful to add a column showing amounts that have already been paid, to track pending balances.

Expenditure items	Preventive	Final balance
Catering	250,00 €	234,00 €
Entertainment	400,00 €	450,00 €
Setup	160,00 €	156,00 €
Safety	120,00 €	140,00 €
Location	850,00 €	700,00 €
Total	1.780,00 €	1.680,00 €

In each model, you can use the filtering and sorting functions to analyse expenses according to specific criteria best suited to your objectives. For instance, if our goal is to observe the expenses of the company's specific department, month, and category of goods, enough to use filters to isolate the expenses of our interest. Additionally, monthly or quarterly reports can be created that are useful for summarizing expenses and comparing them with the estimated budget at the beginning of the period.

USEFUL FUNCTIONS

- **Present budget**
  Useful for calculating the present budget.
  The correct syntax for the formula is as follows: =***Total income – Total expenses***.
- **Sum of expenses by categories.**
  Useful for summing the expenses of specific categories.
  The correct syntax for the formula is as follows: =***SUMIF (Category, "Foodstuff", Amount).***
- **Average daily expense.**
  Useful for calculating average expense.
  The correct syntax for the formula is as follows: =***SUM(Total Expenses) / Days.***
- **Percentage of used budget**
