only in the quantity and price columns, or to allow certain product names or SKUs to be entered.

6. Use Excel's integrated forecasting tools to predict future inventory requirements based on past sales trends. These types of tools can be extremely useful in planning future purchases and avoiding excessive inventory.
7. If you have a bar code scanner, you can use Excel to track inventory using bar codes. In this case, simply set the inventory sheet to include a barcode column and use a special barcode scanner to enter the inventory information. This tool not only saves time but also significantly reduces the occurrence of errors.
8. Excel can be used to set up automatic reorder points in the inventory. For instance, you can use a formula to calculate the reorder point based on average daily sales and lead time, after which you can set an alert that will be triggered when inventory levels fall below the set reorder point.
9. Macros can also be used to automate repetitive inventory-related tasks, such as importing data from other sources, updating inventory levels, or generating reports. This step is useful for reducing input time and errors.
10. Use data visualization to analyse inventory trends. The integrated chart & graph function is ideal for analysing inventory trends over time. For instance, you can create a line chart to show inventory levels over time or a pie chart to show the breakdown of inventory by category.
11. Add-ins can be installed to extend functionality. To date, there are many useful add-ins available for inventory management and analysis. For instance, there are special add-ins to enable barcode scanning or automatic data entry and subsequent display.
12. If there is a need to collaborate with other users on inventory management and analysis, cloud-based solutions such as *Microsoft 365* or *GoogleSheets* can be evaluated. These types of solutions allow multiple users to access the same inventory sheet and update it in real time.

EXAMPLES OF INVENTORY MANAGEMENT AND ANALYSIS

Inventory register

This is the basic application where you simply create columns in which
