delivery. For a more detailed overview, you can add a column in which to enter the expected arrival date.

Sales analysis

The inventory worksheet can also be used to analyse sales trends.
To accomplish this, simply record sales made with product details, quantities sold, sales prices, and dates. Once the data is entered, formulas will allow calculation of revenue generated and trends over time. For this type of analysis, line or column charts are the most suitable as they allow analysis of sales broken down by category, by reference or by period, enhancing the analysis of the most/least sold products and their seasonality.

Deadline control and tracking

For those who work with products subject to expiration, it is also essential to use Excel to track expiration dates.
In this case, simply add a column in which to record the expiration date of each product and use conditional formatting to highlight products that are close to expiration or have already expired.

Product	Quantity	Expiration
A	875	31/12/24
B	345	31/01/25
C	678	31/12/23
D	67	22/06/23
E	435	20/06/23

Reports and analysis

Excel features allow you to create inventory reports and analyses. For instance, PivotTables can be created that are useful for getting an immediate summary of sales by category and/or by product, for analysing inventory costs, for understanding which products are the most profitable, for comparing the performance of each product category, and so on.
Pie, bar, or column charts can also be useful for easy and intuitive visualization of inventory and sales information.
