specific folders) and assign a name to the workbook. Remember to save your work frequently by using the quick key combination *Ctrl+S* for efficiency and data security.

Here, we just saw the basic first steps on accurately inputting data info into an Excel file. As you will gain competence with the software, you'll delve into more advanced functionalities like data formatting, formula usage, and graph creation.

ENTER DATA IN A ROW OR COLUMN

If you only want to enter data in a specific row or column, you need to follow these steps:

	A	B	C
1	1	2	3

1. Select the first cell in the row or column where you want to enter the data.
2. Type the data into the selected cell.
3. Press *Enter* or *Tab* to move to the next cell in the same row. If you want to move up or down in a column, press Enter and use the arrow keys to move up or down to the next cell in the column.
4. Repeat the previous steps (2 and 3) to enter data in the other cells.
5. To enter data in a column, you can select the first cell, type the data and press *Enter*. Excel will then automatically move the pointer to the next cell in the same column.
6. Proceed with inputting data into the cells beneath each column header until all the necessary cells are filled.
7. Once all the data has been entered, it is essential to save the Excel file. You can do this by clicking on "*File*" and selecting "*Save*", or by using the shortcut *Ctrl+S.*

AUTOFILL FUNCTION

The autofill function in Excel is a valuable tool for automatically populating cells with values and formulas like those already present in selected rows or columns. This feature eliminates the need to manually input repetitive information into multiple cells, saving both time and mental effort. Simply enter the initial value, select the cell, and drag the small black square that appears in the cell's lower right corner to efficiently fill in the desired cells
