FIXING COMMON EXCEL ERRORS

The following are common Excel errors and some tips on how to fix them.

- **#VALUE! Error**
  This error occurs when Excel cannot understand the calculation entered. Check that all references and calculations are correct and that you are using the correct syntax.
- **#REF! Error**
  This error occurs when the reference to a cell is invalid. This can occur when a row or column has been deleted or when a formula references a cell that has been moved or deleted. Check the cell references in the formula and correct the errors.
- **#DIV/0! Error**
  This error occurs when trying to divide a number by zero. This can happen if a formula contains a reference to a cell that contains a zero or is blank. To avoid this error, make sure that all cells referenced in the formula contain valid data.
- **#NAME? Error**
  This error occurs when Excel fails to recognize the name of a formula or function. Verify that all formula and function names are spelled correctly.
- **#N/A Error**
  This error occurs when a value is not available in a search formula. Verify that the value you are looking for exists in the lookup table.
- **#NUM! Error**
  This error occurs when a formula or function produces a number too large or too small to be displayed in Excel. Verify that the values used in the formula are within the acceptable range for Excel.
- **#NULL! Error**
  This error occurs when non-existent ranges are referenced in the formula. Verify that all ranges referenced in the formula exist.
