with adjusted content as needed.

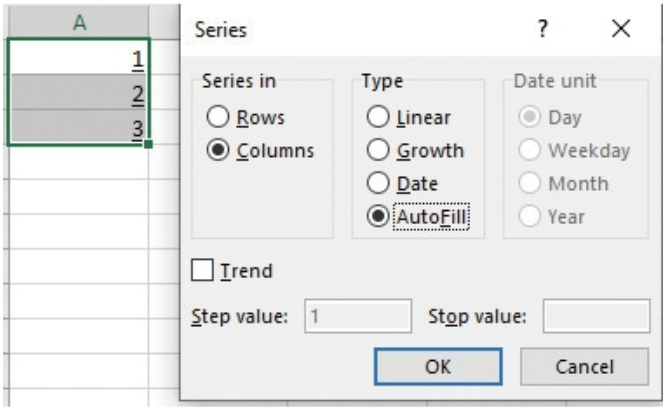

With this feature, users can efficiently fill in cells either manually or automatically. To utilize the manual fill function, follow these steps:

1. Enter the data or formula in the first cell of a column or row.
2. If it is a constant number, for example 3, enter it in the first cell of the column or row.
3. If it is a series, such as progressive numbers, enter the first two numbers in two contiguous cells.
4. Select the cells where you entered the numbers.
5. In the lower right corner of the selected cell or cells, a small square, known as the fill handle, will appear.

6. To enter missing numbers in the next cells, click on the square and drag the box or boxes to the right or down.
7. When you finish, progressive numbers or constant numbers should appear inside the boxes.

If you are not able to follow this method, you can use the *Autofill function*, placed in the *Edit* group. This function is useful when you want to insert the same number in multiple cells belonging to the same row or column.

1. Enter the first number and select it.
