- **Validation:** paste only the data validation rules that have been applied to the selected cells.
- **Keep Source Column Widths:** paste the column width of the copied cells.
- **Values & Number formatting:** paste only the values and all number formatting options from the copied cells.
- **Linked picture:** paste an image with a link to the original cells for dynamic updates.

These are some of the main Paste Special functions commonly used in Excel. However, the exact options available may differ depending on the Excel version and the type of data being copied.

UNDO & REDO FUNCTION

The *Undo* and *Redo* functions in Excel allow you to undo or redo the last actions performed. These commands are particularly useful when you make a mistake or change your mind about an action.

The number of actions you can undo or redo changes depending on the Excel version you are using. Newer versions generally allow you to undo or redo more actions than older versions.

The Undo and Redo commands in Excel are not always available in all scenarios. For instance, when typing within a cell, you cannot undo your typing until you have finished and pressed Enter or clicked on another cell.

The guidelines for using these commands in Excel are as follows:

- **Undo**
  To undo the last action, press the keyboard shortcut *Ctrl + Z* or click the *Undo* button on the *Quick Access Toolbar*. You can undo multiple actions by pressing *Ctrl + Z* multiple times.
- **Redo**
  To repeat the last undone action, press the keyboard shortcut *Ctrl + Y* or click the *Redo* button on the *Quick Access Toolbar*. You can repeat multiple undone actions by pressing *Ctrl + Y* multiple times.
