Wizard. This tool allows you to specify the data type for each column, ensuring accurate import and preventing potential issues.

Excel provides also the *Get & Transform* function, enabling users to transform, combine, and clean data from various sources. This feature allows for the creation of complex queries that merge data from multiple tables, apply filters, sort, and perform calculations. To import data in Excel, follow these steps:

1. Open a new or existing Excel workbook. Select the cell where you want to import the data.
2. Click the *Import* button found on the *File* tab and choose the data source from the menu that will appear. Keep in mind that the data should be available in the desired format. In this instance, we will opt for the *From Text/CSV* option.

3. A window titled "*Import text file*" will now be displayed.
4. Select the desired file from the drop-down menu and click on "*Import data into the current file*".
5. Then *Import Text Wizard* should start.
