

6. In the *Import Text Wizard* panel, select the *Delimited* or *Fixed Width* option, based on the data typing format.
7. Click *Next* after selecting *My data* has headers.
8. On the next page choose one of the delimiters (tab, comma, etc.) and select *Next* to proceed.
9. On the final page, click the "*General Column Data Format*" button and select the "*Finish*" button.
10. A window will now prompt you to specify the location within the Excel worksheet where the data should be entered.

11. Select one of the options within *Table*, *PivotTable Report*, etc. in the dialogue box. You will need also to decide where to store the information; if you want to use an existing worksheet, choose a cell address. In many cases the default setting is sufficient. Then, to import the data, click on the OK button.

NOTE: Select the "Existing Connection" option if you wish to use a table already created in the workbook as the import source. In this scenario, you need to choose the table you want to open and navigate to the Tables tab in the dialogue box.
