These formulas are specific for operations with arrays or ranges of cells. For example, the formula *{=SUM(A1:A5*B1:B5)}* can calculate the sum of the products of the values of cells A1:A5 and B1:B5.

- **Financial Formulas**
  Financial formulas, as the name suggests, are mostly used to perform calculations related to the world of finance, like calculating loan payments or interest rates.
  An example it's the formula *=PMT(0.05/12.5*12.100000)*, which helps you calculate the monthly payment of a 100,000-euro loan with an annual interest rate of 5% for 5 years.
