

NOTE: The error #DIV/0! in Excel occurs when attempting to divide by zero, which is mathematically undefined. Excel recognizes this error and prevents the division by zero from proceeding.

FORMULA ORDER

When calculating the equation = 2 + 4 * 6 / 3 - 2, it's crucial to follow the mathematical procedure known as PEMDAS to determine the order of operations. In this case, the priority order is as follows:

- P = Parentheses
- E = Exponents
- MD = Multiplication and Division (from right to left)
- AS = Addition and Subtraction

This means that the solution to the equation provided is 8. Excel can also assist in obtaining the correct answer. For instance, if you input the equation into a cell and press Enter, the resulting value will be displayed:

To achieve the result of 8, Excel follows the order of operations: division *(6/3=2)*, then multiplication *(4*2=8)*, followed by addition *(2+8=10)*, and finally subtraction *(10-2=8)*.

However, if we introduce parentheses, for instance, *=2 + 4 * 6 / (3 - 2)*, the result will vary significantly due to the altered grouping of operations dictated by the parentheses.
