

3. Specify the arguments of the function.
   In the second step of the guided procedure, input the function parameters. Familiarity with the function syntax is not required as the guided procedure will handle the rest once cell or range references are correctly entered in the designated boxes.
   At this point, you can choose a cell or range of cells in the worksheet by clicking on the range selection icon next to the field or by placing the cursor in the field box. This action will reduce the size of the range selection box. When you exit the dialog box with the mouse, it will return to its original size.
   Below the function description a brief explanation of the selected topic is shown. For further explanation, click on the *Help link on this function*.
   You can employ Excel functions to carry out calculations involving cells not only on the same worksheet but also on other sheets or even different workbooks. The value or array of values from the selected cells will appear in the designated field box as soon as it is entered.
