

4. Complete the formula.
   After entering the arguments, simply click the OK button or use the Enter key to enter the complete formula into the selected cell.

MOST USEFUL FUNCTIONS AND FORMULAS

In Excel, the utility of each function is tied to the user's specific requirements. However, we have compiled a list of the most commonly used functions by Excel users.

EXCEL TEXT FUNCTIONS (STRING FUNCTIONS)

In addition to the traditional mathematical functions, Excel offers users various text functions, also known as string functions, enabling the manipulation of text in diverse ways. Some of the most used text functions include:

- **TEXT Function**
  The TEXT function can be used to transform a number or date into a text string in the desired format. The TEXT function is beneficial when the cell contains a numeric value that requires conversion into text format. This function enables you to obtain the output in text format instead of numeric.
  For instance, the function *=TEXT(A1; "dd/mm/yy")*, which allows you to convert the date in cell A1 to a text string in the traditional format such as "*01/01/23*" (month/day/year).
  Another example, the function *=TEXT(A1; "€#,##0.00")*, which is useful for converting the number in cell A1 to a currency text
