without adding separators or spaces.

- **TRIM Function**
  As its name implies, the TRIM function in Excel is applied whenever you need to remove leading or trailing spaces from a text string. However, it's important to note that this function removes spaces at the beginning or end of the string but not those within the string itself.
  To apply it correctly, the syntax is as follows:

=TRIM(text)

In this case, "*text*" stands for the text string you want to cut. For instance, if the following text is present in cell A1: "*Luca Rossi*," you can use this function to remove the leading space present in this text string. To do this, simply type in the formula *=TRIM(A1)*.
In this case, the result will be "*Luca Rossi*".

The TRIM function is often used together with other text functions such as CONCATENATE, to remove any extra spaces that may appear when joining multiple text strings.

- **SUBSTITUTE Function**
  This function can be used whenever it is necessary to replace specific text or a part of text within a cell filled with a different text or font.
  This formula is often used to replace a specific character, word, or phrase within a cell or text string. To apply it correctly, the syntax is as follows:

=SUBSTITUTE(text; old_text; new_text; occurrence)

The arguments in the formula represent:

- ***Old_text:*** the text you want to replace.
- ***New_text:*** the new text or character that will be used to replace
