the existing content.

- ***Occurrence:*** Optional parameter to specify which occurrence of the text to replace. Defaults to replacing all occurrences.

Let's say you want to swap all commas in cell A1 for semicolons. In this case, you'd use the following formula:

=SUBSTITUTE(A2, ",", ";")

NOTE: The *SUBSTITUTE* function is case. This means it will only replace occurrences of the exact text you specify, considering upper and lower case. In that case you can use the *UPPER*, *LOWER* or *OWN* function to convert the text before using the *SUBSTITUTE* function.

- **VALUE Function**
  This function is useful when you want to convert a text value that represents a number into a genuine numerical value. To apply it correctly, the syntax is as follows:

=VALUE(text)

Here, "text" refers to a text string that represents a number.
For example, if the following text string "123" was inside the cell A1, You can convert it to a numeric value in cell B1 using the following formula:

=VALUE(A1)

In this case, the value that will appear in cell B1 will be the numerical value 123.

NOTE: The *VALUE* function can only convert text strings that stand for valid numeric values. If the text string cannot be converted to a numeric value, the *VALUE* function will show the following error: *#VALUE!*

- **EXACT Function**
