This function compares two distinct text strings. The result is *TRUE* if they are the same, including upper and lower case characters. Conversely, if the two strings are not identical, the formula will return *FALSE* as the result.
To apply it correctly, the syntax is as follows:

=EXACT(text1; text2)

"*text1*" and "*text2*" represent the two text strings to be compared.
Here are some concrete examples of how to use this function:

=EXACT("apple", "apple") will result in TRUE
=EXACT("Apple", "apple") will result in TRUE
=EXACT("apple", "banana") will result in FALSE

This function can be useful whenever you want to compare two text strings, ensuring that upper and lower case are also the same.

- **Upper and Lower Functions**
  Among its functions, Excel also has three functions for changing the lower and upper case of text. They are named *UPPER*, *LOWER* and *PROPER*. Let's have a look at them one by one.
  The *UPPER* function enables all letters in a string to be changed to capital letters. To apply it correctly, the syntax is as follows:

=UPPER(text)

The argument "*text*" represents the text string you want to capitalise.
For example, if cell A1 has the following text: "*hello everyone*", you can capitalise it by entering the following formula in another cell:

=UPPER(A1)

The result will be, "*HELLO WORLD*".
