

The *LOWER* function, on the other hand, changes all letters in a text string to lowercase. To apply it correctly, the syntax is as follows:

=LOWER(text)

Using the previous example, you can convert "*HELLO WORLD*" to lowercase by entering the following formula in another cell:

=LOWER(A1)

The result will be "*hello world*".

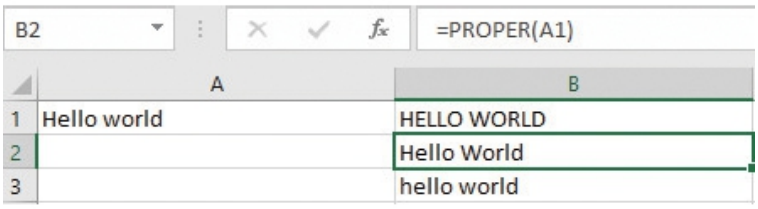

The *PROPER* function enables you to change the first letter of each word to uppercase. The other letters will be changed to lowercase instead. The correct syntax of the function is:

=PROPER(text)

In this case, we can change "hello world" with the following formula:

=PROPER(A1)

The result will be "*Hello World*".

NOTE: all these functions can also be applied together with other functions to create more complex scenarios.
