extract characters, "*start_num*" the position of the first character to be extracted, and "*num_chars*" the number of characters to be extracted.
Using the previous example, characters beginning at position 6 and ending at position 10 can be extracted by entering the following formula:

=MID(A1; 6; 5)

The result will be "*world*".

NOTE: all these functions can also be applied together with other functions to create more complex scenarios.

LOGICAL FUNCTIONS

Excel has numerous logical functions which can be used to perform logical operations on the data entered. n the following pages, you will find some of the most commonly used logic functions in Excel:

- **AND, OR, XOR FUNCTIONS**
  Let us have a first look at how these functions work.
  The *AND* function checks that all specified conditions are true; it will return TRUE if they are and FALSE if they are not. The correct syntax of the function is:

=AND(condition1; condition2; ...)

For instance, if we want to check if two conditions are true, we can use the following formula:

=AND(A1>5; B1<10)

The formula will result in *TRUE* only if the value in cell A1 is higher than 5 and the value in cell B1 is lower than 10.
