

The *OR* function enables you to check whether any of the specified conditions are true and will result in *TRUE* if at least one of them is otherwise, the result will be *FALSE*. The correct syntax for the formula is as follows:

=OR(condition1; condition2; ...)

For instance, the *OR* function can be used to check whether at least one of the following conditions are true:

=OR(A1>5; B1<10)

In this case, the formula will result in TRUE if the value in cell A1 is higher than 5, or if the value in cell B1 is lower than 10, or if both conditions are true.

The XOR function checks whether an odd number of the specified conditions are true. The formula will result in TRUE if it is and will return in FALSE if it is not. The correct syntax of the formula is:

=XOR(condition1; condition2; ...)

To check whether an odd number of two conditions is true, you can write:

=XOR(A1>5, B1<10)

This formula will result in *TRUE* only if the value in cell A1 is higher than 5 or if the value in cell B1 is lower than 10. If neither or both conditions are true, the formula will result in *FALSE*.
