

NOTE: all these functions can also be applied together with other functions to create more complex scenarios.

- **IF Function**
  The IF function is well-known because it enables you to check a condition and will show a different value if either the condition is fulfilled or not fulfilled. The correct syntax for the formula is as follows is:

=IF(logical_test, value_if_true, value_if_false)

The "*logical_ test*" argument represents the condition to be tested, while "*value_if_true*" represents the value which will be shown if the condition is true. Conversely, "*value_if_false*", represents the value which will be shown if the condition is not true.
Let's make an example if we have a column of numbers extending from A1:A5. Our goal is to highlight the cells with a number higher than 50 with the word "Passed" and cells with a number lower than or equal to 50 with the word "Failed." In this case the cell B1, the correct syntax for the formula is as follows:

=IF(A1>50,"Passed","Failed")

Once you click on *Enter*, you will simply drag the formula into cells B2:B5 by clicking and dragging the small fill box located in the lower right corner of cell B1.
This will make the formula evaluate each cell in column A and name each cell with "*Passed*" or "*Failed*".
