

There are different ranges of grades that can be entered in evaluations; however, nesting is necessary in these cases.

NEST FUNCTIONS

The term “nested” in Excel refers to all instances in which one or more functions are used as arguments within a more complex function.

For example, the logical IF function can be created using the SUM function or the AVERAGE function as arguments.

Therefore, the following steps should be taken:

1. Enter the “=” *sign* within the selected cell.
2. Type in the required formula (*IF, OR, SUM*, etc.). If you have doubt, you check the “*Search for a function*” section and search for the most suitable formula to your need.
3. Once you selected the function, enter the required arguments for the formula. If you want to use another function, simply type the formula within the argument.
4. Complete the formula with the required arguments.

Using the previous example where we need to transform student scores into text output. In this case we will use nested IF function to generate different results depending on the score achieved by each student.

We will need to include an IF function for each grade range we want to emphasize. For instance, we can designate scores below 60 as insufficient, scores between 60-69 as sufficient, scores between 70-79 as good, scores between 80-90 as distinct, and 100 as excellent.

The resulting nested formula will then be as follows:

=IF(A1>85;”EXCELLENT”;IF(A1>79;”Distinct”;IF(A1>69;”Good”;IF (A1>60;”Sufficient”;
IF(A1>10; “Insufficient”)))))
