in the range that satisfy the criteria.
For instance, if you have a range of cells A1:A10 containing numbers and you wish to sum only those higher than5, you can use the function as follows:

=SUMIF(A1:A10; “>5”)

The *SUMIFS* function, on the other hand, enables the summation of values within the range that satisfy multiple criteria or conditions. The correct syntax for the formula is as follows:

=SUMIFS(sum_range; criteria_range1; criteria1; [criteria_range2, criteria2]; ...)

The “*sum_range*” argument represents the range of cells to be summed, the “ *criteria_range1*” argument is the range of cells to be evaluated for the first condition, and the “ criteria1” argument stands for the criteria or conditions to be satisfied. Finally, the “*criteria_range2*” and the “ *criteria2*” arguments represent an optional set of additional ranges and criteria to be evaluated.
For instance, if you have a table with columns A, B and C containing data, and you wish to sum the values in column C only if column A contains “Apples” or if column B contains “Pears,” you can use the function as follows:

=SUMIFS(B:B; A:A; “Apples”)

Below is an example demonstrating the usage of the function with real data:
