

NOTE: it is important to note that the criteria range and the sum range must have the same number of rows and columns.

- **SUMPRODUCT Function**
  This type of function performs multiplication on elements belonging to one or more arrays and sums their products. The correct syntax for the formula is as follows:

=SUMPRODUCT(array1; array2; array3; ...)

The function considers arguments with one or more arrays and consequently provides the sum of the products of the corresponding elements. To simplify, imagine having two arrays of numbers in cells A1:A4 and B1:B4. The goal is to obtain the sum of the products of the elements in the two arrays. In this case, we can use the following formula:

=SUMPRODUCT(A1:A4; B1:B4)

In this process, Excel will multiply each element in cells A1:A4 by the corresponding element in B1:B4 and then sum the resulting products.
Additionally, you can also use this function for a wide range of calculations, like calculating weighted averages or counting cells that meet multiple criteria.
