- **Round Functions**
  Several useful functions are available within Excel for rounding numbers to a predetermined number of decimal or significant digits. In this section, we will concentrate on the most frequently used functions of this type.
  The *ROUND* function is the main one that enables you to round a number to a specific number of decimal places. The correct syntax for the formula is as follows:

=ROUND(number; num_digits)

The "*number*" argument stands for the value we want to round, and the "*num_digits*" arguments stands for the number of decimal places to which you want to round that value.
For instance, if you want to round the number 3.14159 to two decimal places, you can use the following formula:

=ROUND(3,14159; 2)

In this case, the result will be 3,14.

The *ROUNDUP* function, on the other hand, is used to round up while keeping a given number of decimal places. The correct syntax for the formula is as follows:

=ROUNDUP(number; num_digits)

The "*number*" argument stands for the value we want to round, and the "*num_digits*" argument stands for the number of decimal places to which we want to round the number.
For instance, to round the number 3.16739584 to only two decimal places, you can use the following formula:

=ROUNDUP(3,16739584; 2)

In this case, the result will be 3,17.
