

Additionally, there is the rounding down function, ROUNDDOWN, which is employed to round a number downwards while maintaining a specified number of decimal places. The correct syntax for the formula is as follows:

=ROUNDDOWN(number, num_digits)

For instance, to round the number 3.14159 to 2 decimal places using the ROUNDDOWN function, you can use the following formula:

=ROUNDDOWN(3,14159; 2)

In this case, the result will be 3,14.

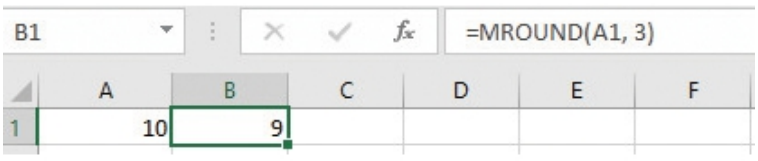

The *MROUND* function is used in cases where it is necessary to round a digit to the nearest multiple of a specified number. The correct syntax for the formula is as follows:

=MROUND(number, multiple)

The "*number*" argument stands for the number you want to round, and the "multiple" argument stands for the multiple to which you want to round the number.
For instance, to round the number 10 to the nearest multiple of 3, you can use the following formula:

=MROUND(10; 3)

In this case, the result will be 9.

The *CEILING* function is used to round up a number to the nearest
