deducts 0.5 from the number, rounds it to 0 decimal places, and then subtracts 1 from the result to obtain the nearest even number.

Then, rounding to a specific number of digits can be achieved using formatting. Indeed, alongside utilising rounding functions, cells can be formatted to display numbers with a specified number of decimal places.

For this procedure simply select the cells you want to format, right-click and choose *Format Cells*, then choose the *Number* tab and select *Number* as the category. Finally, you can specify the number of decimal places you want to display in the *Decimal Places* field.

It's worth noting that this process does not alter the underlying value of the cell; it merely affects its display.

You can adjust the format of a cell and the number of decimals in the relevant section on the Ribbon Bar. In this scenario, simply select the desired format from the drop-down menu and use the appropriate buttons to increase or decrease the number of decimals.
