

- **MOD Function**
  This function enables you to obtain the remainder after a division. It requires two input arguments: the number to be divided and the divisor. The correct syntax for the formula is as follows:

=MOD(number; divisor)

For instance, to obtain the remainder after dividing 10 by 3, you can use the following formula:

=MOD(10;3)

In this example the result will be 1, since 10 is divided by 3, the remainder is 1.

Furthermore, cell references as arguments for the MOD function. For instance, if you want to obtain the remainder after dividing the value of cell A1 by the value of cell B1, you can use the following formula:

=MOD(A1;B1)

Certainly, if the divisor is 0, the function will return the *#DIV/0* error!
