

The result ranges from -1 to +1, where -1 indicates a negative correlation and +1 indicates a positive correlation. A positive correlation means that as the numbers in one range increase, so do the numbers in the second range. Conversely, a negative correlation shows an inverse relationship between the two arrays. The closer the result is to 0, the weaker or even non-existent the correlation between the two data sets.

It's important to note that this function only analyses cells with numeric values. cells with text, logical values, or empty cells are not considered.

- **FREQUENCY Function**
  Calculates the frequency distribution of values within a specified range.

=FREQUENCY(num1;num2;num3; …)

- **RANK Function**
  This function enables obtaining the rank of a number within a range of numbers, indicating its position relative to the other values in the selected range.
  The correct syntax for the formula is as follows:

=RANK(num1;num2;num3; …)
