

In the example shown in the image above, we want to determine the rank of the number 2 within the cell range A1:E1. In this case, the result will be 4, as the number 2 is in the fourth position (with rank 1 represented by the number 5).

To access all these functions, simply select the Excel Formulas tab and click on More Functions. From there, you can also view all available functions in list form.

LOOKUP & REFERENCE EXCEL FUNCTIONS

The *LOOKUP & REFERENCE* functions group together all functions that enable you to search for specific values within a table or cell range. These types of formulas return corresponding values derived from another column or row.

- **VLOOKUP Function**
  This function, named "vertical lookup," retrieves a value from another column in the same row when a particular value is found in the first column of the table.
  The correct syntax for the formula is as follows:

=VLOOKUP(lookup_value; table_array; col_index_num, rang_lookup)

The " *lookup_value*" argument indicates the value to be searched, while the "*table_array*" argument stands for the range of cells comprising the table in which you want to search.
The "*col_index_num*" argument, on the other hand, indicates the number of the table column containing the value you wish to obtain as output. For instance, if you seek the value found in the third column of the table, you should input 3. Finally, the "*range_lookup*" argument is an optional argument but can be used if you want an exact match (*FALSE*) or an approximate one (*TRUE* or omitted). When using *TRUE* or omitting this field, Excel will locate the closest match to the
