function is useful for retrieving a specific value from the table, like the sales data for product "*X*" in the second quarter of the year in Lazio. In this case, you can use the following formula:

=INDEX(A1:D9; 8;4)

	A	B	C	D	E
1	PRODUCT ID	REGION	QUARTER	SALES	
2	1111	Marche	1	243.340	
3	1111	Lombardia	1	343.393	
4	1111	Lazio	1	934.834	
5	1111	Emilia Romagna	1	389.393	
6	1111	Brands	2	423.343	
7	1111	Lombardy	2	211.587	
8	1111	Lazio	2	343.444	
9	1111	Emilia Romagna	2	676.421	
10				343.44400 €	

- **MATCH Function**
  This formula aids in determining the position of a specified value within a range of cells or an array. The correct syntax for the formula is as follows:

=MATCH(lookup_value, lookup_array, match_type)

The "*lookup_value*" argument stands for the value you want to search within the range, while the "*lookup_array*" argument stands for the range of cells in which you want to search. Finally, the "*match_type*" argument stands for the optional argument that is useful for specifying the type of matching you want to perform.
Specifically, there are three options:

- ***1: for an exact match,***
- ***0: (or omitted) for approximate matching,***
- ***-1: for exact or approximate matching***

For instance, if we had a list of product names in one column and wanted to find the position of a specific product within the list, we could use the *MATCH* function. If the list starts from cell A2 and has
