	A	B	C
1	Product	Quantity	Price
2	A	10	
3	B	15	
4	C	20	
5	D	25	

	A	B
1	Product	Price
2	C	5.0
3	B	6.5
4	D	7.2
5	A	8.1

In this case, you can use the following formula:

=INDEX(Table2!$B$2:$B$5;MATCH(A2,Table2!$A$2:$A$5,0))

If we examine the formula closely, we can deduce that it performs several operations:

- The *MATCH* function searches for the product code in the product table and returns the corresponding row.
- The *INDEX* utilizing the row obtained from the MATCH function, retrieves the price from the corresponding column of the product table.

- **INDIRECT Function**
  This function is used to obtain a reference to a cell or cell range specified by a text string. The *INDIRECT* function requires a text argument specifying the cell range or cell to which you want to refer. In the selected cell, it returns the value present in that cell or
