range.
The correct syntax for the formula is as follows:

=INDIRECT(Ref_text; "TRUE/FALSE")

The text string that contains the reference to the cell you want to create is denoted by "*Ref_text*". This can be a direct reference to the cell or a named range. The "*true/false*" argument, however, is optional and specifies the type of reference you desire.
If set to *TRUE* or omitted, the function will return a reference of type A1. If set to *FALSE*, the function will return a reference of type R1C1 (where R indicates the row and C indicates the column).
For instance, imagine we have a list of sales data, and our goal is to reference a specific cell in column B based on the value in cell A2. If the text string "B4" is present in cell A2, the following formula can be used to have the desired cell display the value corresponding to the text "B4" in cell A2:

=INDIRECT(A2; TRUE)

In this case, the formula will output the value of cell B4. If you change the value of cell A2 to "B2," the formula will update to refer to the cell in column B corresponding to the new value (in this case 242,340 €).

- **OFFSET Function**
  The *OFFSET* function enables referencing a range of cells that is a specified number of columns and rows away from a starting cell or range.
  The correct syntax for the formula is as follows:

  =OFFSET(reference; rows; cols; [height], [width])
