cells as an argument and returns a transposed array or range as output. The correct syntax for the formula is as follows:

=TRANSPOSE(array)

The “array” argument stands for the range of cells or arrays to be transposed.
For instance, if you have a vertical range of cells containing numbers in the range A1:A4, you can utilize the following formula to transpose them into a horizontal range:

=TRANSPOSE(A1:A4)

This formula will yield a horizontal range of cells with the same numbers as the original range but transposed.

ATTENTION!
This formula, along with all other array formulas that need to copy multiple cells, must be confirmed by pressing the keyboard combination *CTRL + SHIFT + ENTER*.

NOTE: this function can only be used to transpose arrays with sizes up to 65,536 rows and columns.

- **HYPERLINK Function**
  This function is useful for generating hyperlinks to other files, web pages, and various locations within a workbook. It enables the creation of clickable links within Excel worksheets, directing users to other sections within the workbook, external files, or web pages.
  The correct syntax for the formula is as follows:

  =HYPERLINK(link_location; [friendly_name])
