The "*link_location*" argument stands for the address of the file or web page you want to link to. It can be a URL, a UNC path, or a file path. The "*friendly_name*" argument, however, is optional and stands for the text displayed in the cell as a hyperlink. If this argument is omitted, the hyperlink will display the address of the referenced path.
For instance, to create a hyperlink to a web page named www.example.com in cell A1, you can use the following formula:

=HYPERLINK("http://www.example.com"; "Example Web Site")

This will display the chosen name in cell A1, and clicking on it will give direct access to the selected web page.

FINANCIAL FUNCTION

Excel offers a wide range of useful tools for financial analysis, among which there are many financial functions. These functions prove to be extremely useful in analysing financial data and facilitating informed business decisions. In this section, we will explore the most commonly used financial functions in Excel.

- **FV Function**
  The *FV* (Future Value) function is a financial function designed to compute the future value of an investment or a series of regular payments, taking into account fixed interest rates and a specified number of periods.
  This function proves useful for determining the future value of various financial scenarios, including lump sum investments, instalment payments (e.g., mortgages or loans), or a combination of both. The correct syntax for the formula is as follows:

=FV(rate, n_per; pmt; [pv]; [type])

The "*rate*" argument stands for the interest rate for each period, while the "*n_per*" argument stands for the total number of periods
