This function determines the last day of the month relative to the entered date, accounting for a specified number of months. The “months” argument specifies the month’s end you want to locate. If the number is positive it refers to future months, if negative it refers to past months.

=EOMONTH(start_date;months)

- **DATEDIF Function**
  This function calculates the distance between two dates, expressing the result in years, months, or days, based on the specified unit. The “*unit*” argument precisely indicates the desired unit.
  For instance, “Y” represents years, “M” represents months, and “D” represents days. You can also combine these values, such as “MD” to obtain the difference in terms of months and days.

=DATADIF(starte_date; end_date; unit)

- **NETWORKDAYS Function**
  This function calculates the number of working days between two dates, excluding weekends and specified holidays.

=NETWORKDAYS(start_date;end_date;[holidays])
