member countries. These publications often appear in books, articles in journal, working papers, occasional papers and the internet.

However there prevails a general criticism that the MIF, at present, function as an institution to promote corporate interests, through commercialisation of the services, including education and health, and by subordinating peoples' welfare and development to profiteering business interest, and the sovereign states are compelled to be subservient to international corporate business.

11.6 Asian Development Bank

Unlike the IMF which is largely self-financing, Multilateral Development Banks (MDBs) are highly dependent on shareholder contributions particularly in terms of financing their operations of their soft loan windows, that provide grants and low interest loans to very poor countries. MDBs belong to a complex set of public institutions that can be categorized as (i) global, (ii) regional and (iii) Sub-regional. Categorizations of all MDBs are done by taking into consideration their regional coverage. This facilitates the process of clearly understanding the similarities and differences among them by using common denominators rather than extensive individual assessments.

Most MDBs fall in the above mentioned three categories and directly target a particular continent such as the Asian Development Bank, the African Development Bank, Asian Infrastructure and Investment Bank, New Development Bank, Inter-American Development Bank, Islamic Development Bank, European Investment Bank, etc. During the late 1930s and early 1940s, the concept of economic development began to emerge in the contemporary sense. The prominent British economist John Maynard Keynes addressed economic and social needs that emerged in the post-war period. Harry Dexter White- an American economist was a key figure in envisioning the set of institutions that were to be created as envisioned by John Maynard Keynes. White, in the year 1942 paved the path towards the fundamentals of a development policy when he prepared a proposal for a United Nations Stabilization Fund and Bank for Reconstruction and Development of the United and Associated Nations, that would provide the basis for a post-war international monetary reform. The proposal called for the creation of two related institutions with the powers, resources and structure adequate to address major issues in the post-war period.

MDBs such as the World Bank and the Asian Development Bank (ADB) are publicly financed institutions that are responsible for setting the development agenda of their member countries. Almost all countries in the world with the exception of Cuba and North Korea are members of MDBs. All countries with membership in MDBs contribute to the institution since they are affiliated to and avail loans from them. MDBs emphasize that largescale development projects such as hydroelectric dams, irrigation projects, transportation development, oil and gas projects have the potential to reduce poverty and increase economic activities that would be aimed at development. However, on the contrary, there are others who oppose such development projects since they have terrible consequences to the environment and their lives, negates the Banks' claim. Many argue that the damage done through these projects not only affect their welfare, but have negative social, economic and environmental results that are irreversible.
