Function Calling:

Once a function is defined it is execulied by a function call. The programmer has to give a functions Call inside the respective program.

SYNTAX:

functionName();

Example:

```
<?php
function insertMsg() {
   echo “Student Details Inserted Successfully!”;
}
insertMsg(); // call the function
?>
```

Pre-defined or system or built in function PHP has a wide collection of built-in functions that can be called directly from with in a script, to perform a specific task. These built in function are what make PHP a very efficient and productive. Scripting language no installation is required to use these functions. The PHP built in function may be classified into various caligories like;

PHP string function	–	Functions that help us to manipulate strings
PHP array function	–	Functions that allow you to access and manipulate arrays.
PHP math function	–	Functions that help to perform mathematical operations
PHP MySQLi function	–	Functions that allows you to access MySQL database servers.
PHP file system function	–	Functions that allow you to access and manipulate the file system

5.1 Parameterized Function

Values can be passed from one function to another function thru parameters.

The parameter is also called as arguments, it is like variables.

The arguments are mentioned after the function name and inside of the parenthesis. There is no limit for sending arguments, just separate them with a comma notation.

Example 1:

The following example has a function with one Argument ($sfname):

```
<?php
function School_Name($sname) {
```
